Cyclotron dismantling – International experience

Content

- **Context-foreword**
- **Situation worldwide and in Belgium**
- **Characterization - elaboration of the radioisotopes vectors – streams segregation**
- **Second hand market - Decay**
- **Recycling – Final storage**
- **Sampling size - concrete activation**
- **Good practices**
- **Recommendations for new facilities**
- **Conclusions**

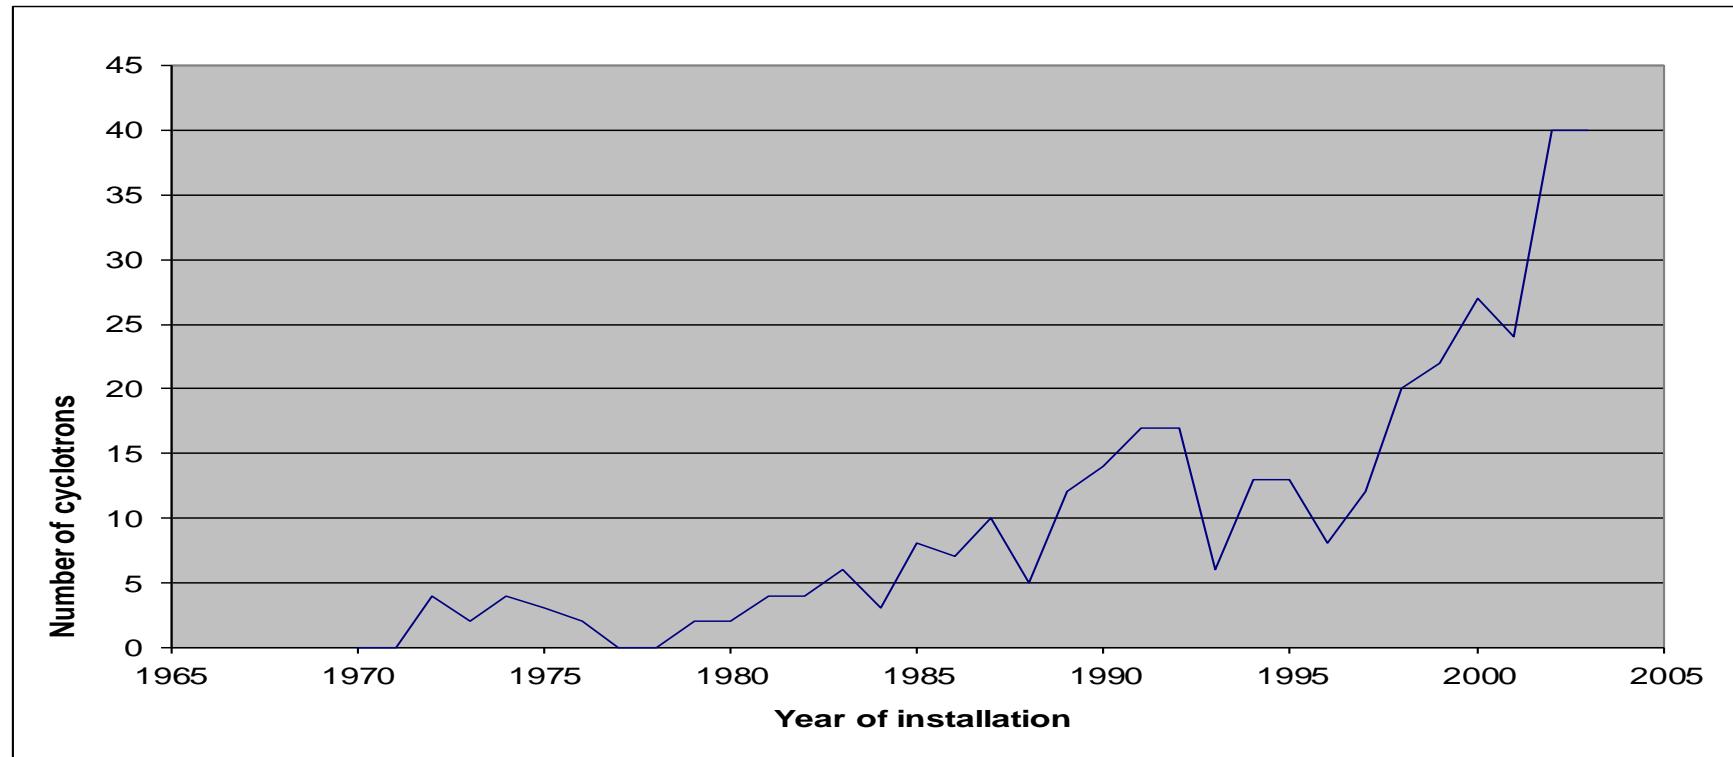

Dismantling of low energy cyclotrons (≤ 30 MeV) Foreword

- **Bel V workshop (1, 2016):** Dismantling cyclotron, Application of international REX to Belgian situation
- **R&D program (2020):** Accelerator decommissioning
- **Eurosafe meeting (1, 2021):** Challenges raised by the dismantling of an accelerator used for radio-isotopes production
- **Mirdec meetings (5, 2021-2022):** Situation in Belgium, Situation-regulatory framework, Decommissioning of low energy cyclotrons in Belgium, Decommissioning of low energy cyclotrons (≤ 30 MeV).
- **IBA meetings (4, 2021-2022):** Situation-regulatory framework, Database construction, Concrete characterization-design improvements, Recycling fluxes (recycling rate $> 95\% ?$)
- **Protons accelerator of low energy (≤ 30 MeV) (can theoreticly be extended to ≤ 70 MeV)**
- **International dismantling experience (no domestic file)**
- **Dismantling file, datas, scientific litterature survey**

IAEA, NW-T-2.9, Decommissioning of particle accelerator

IAEA, TRS 44, Decommissioning of small medical, industrial and research facilities

Situation worldwide

2002 : 246 cyclotrons.
2006 : 262 cyclotrons registered,
350 believed to be set up.
Since then +/- 50 machines are believed to be set up per year.
2022 : +/- 1300 accelerators
10 % market growth until 2025

IAEA Tecdoc-1007.

IAEA-Directory of cyclotrons used for radionuclide production in member states 2002.

IAEA-Directory of cyclotrons used for radionuclide production in member states 2006.

IAEA-Directory of cyclotrons used for radionuclide production in member states 2019.

Situation in Belgium

Localisation	Type of cyclotron
IBt > Bebig > Telix (Seneffe)	Cyclone-14+ (S0), Cyclone-14+ (S1)
UCL (LLN)	Cyclone-30, Cyclone-44 and 100 (LLN)
Erasme (Brussel)	Cyclone-30
Ulg (Liège)	Cyclone-18/9, CGR MeV
VUB (Brussel) UZB	CGR MeV, Kiube
KUL (Leuven)	Cyclone-18/9, Protheus 1, Protheus 2
UG (Gent) INW	Cyclone-18/9, CGR MeV
UZA (Antwerpen)	RDS 111
Onsf... (Fleurus)	Cyclone-30, CGR MeV
IRE-Elit (Fleurus)	Cyclone-AE
St Luc (Woluwe)	Cyclone-18/9

+ Kiube Ulg (IBA), Proteus 1 Charleroi (IBA), Ikon 30 IRE (IBA), Smart IRE (ASML), Ac 225 SCK (IBA), Minerva SCK
 + Cyclone « Key » (IBA) ?, « Mini trace » (GE) ?

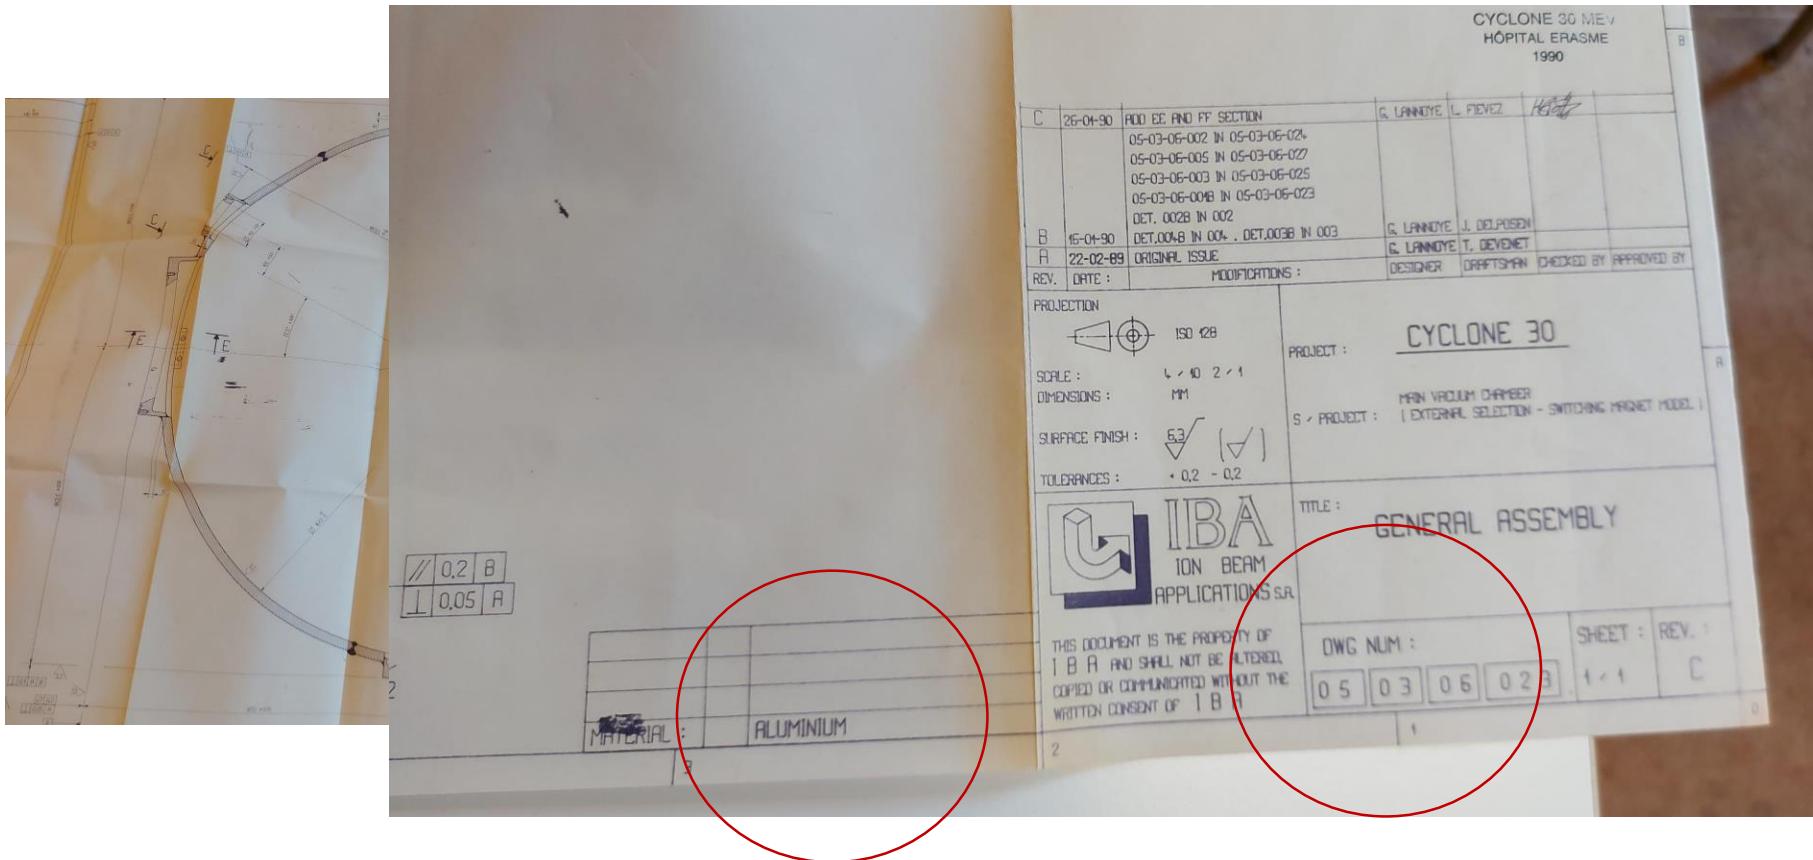

Decommissioning of low energy cyclotrons (≤ 30 MeV)

Material <> Activation

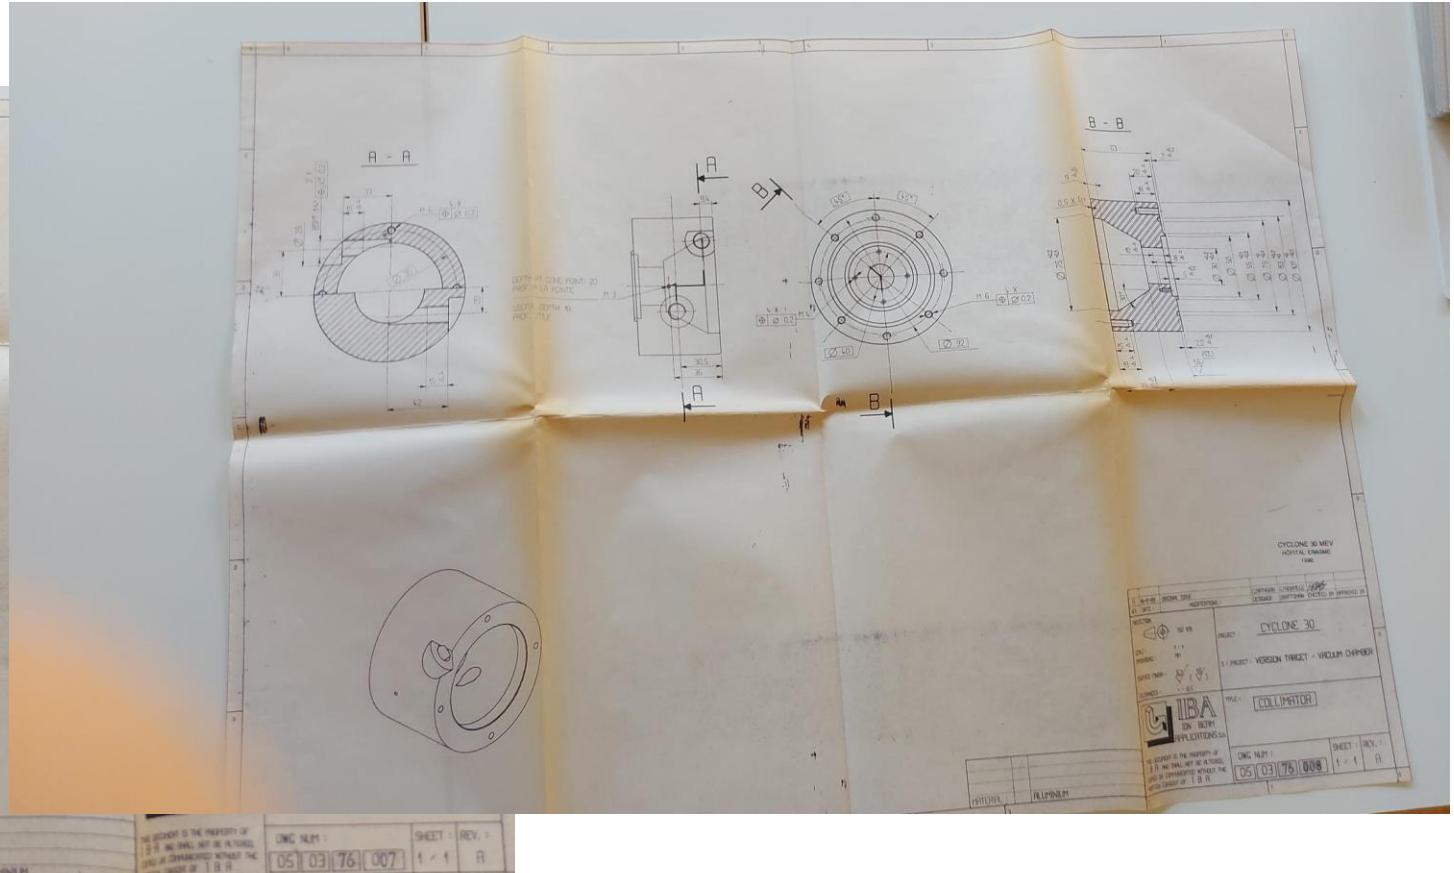

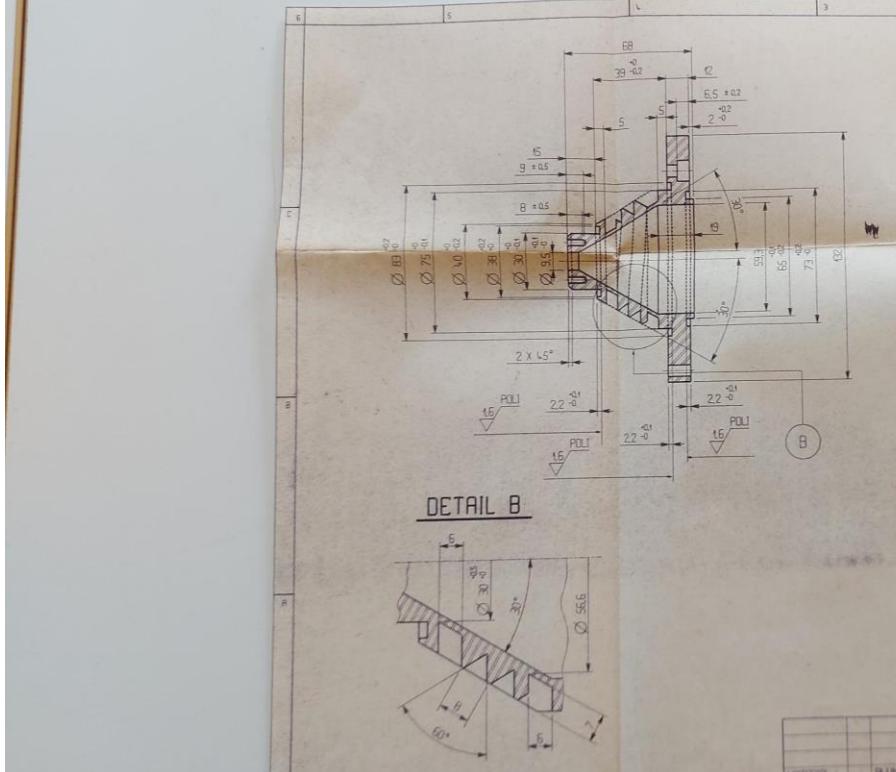

Al (4-10 %), Steel (82-84 %), Cu (8-10 %), Polymers, concrete

	Material	Primary beam (protons)	Secondary beam (neutrons)
Yoke	Steel		X
Sector	Steel	X	X
Beam line	Al	X	X
Ion sources	Cu	X	X
Dees	Cu	X	X
Coils	Cu		X
Collimator, stripper fork, ...	Al	X	X
Bunker	Concrete, steel rebars		X
Isolation material	Polymers	X	X

Material traceability

Localisation of the sub systems > primary beam, secondary beam

Decommissioning of low energy cyclotrons (≤ 30 MeV)

Copper

Co-60, Ag-110m, Ni-65, Ni-63, Cu-64, Ag-110, Ag-108m, + ...

Radioisotope	Co-60	Ag-110m	Ni-63	Ag-108m
Nuclear reaction	$^{63}\text{Cu}(\text{n},\alpha)^{60}\text{Co}$	$^{109}\text{Ag}(\text{n},\gamma)^{110}\text{mAg}$	$^{63}\text{Cu}(\text{n},\gamma)^{63}\text{Ni}$	$^{107}\text{Ag}(\text{n},\gamma)^{108}\text{mAg}$
Quantification	0.1-20 Bq/gr	0.05-0.2 Bq/gr	0.5-100 Bq/gr	0.09 Bq/gr

Radioisotope	Co-60	Ag-110m	Ni-63	Cd-109	Ag-108m	Zn-65
Nuclear reaction	$^{63}\text{Cu}(\text{n},\alpha)^{60}\text{Co}$	$^{109}\text{Ag}(\text{n},\gamma)^{110}\text{mAg}$	$^{63}\text{Cu}(\text{n},\gamma)^{63}\text{Ni}$	$^{109}\text{Ag}(\text{p},\text{n})^{109}\text{Cd}$	$^{107}\text{Ag}(\text{n},\gamma)^{108}\text{mAg}$	$^{65}\text{Cu}(\text{p},\text{n})^{65}\text{Zn}$

IAEA TRS 468, Cyclotron produced radionuclides: Physical characteristics and production methods.

Neutrons energy (+/- = 10 MeV)

Concrete streams

Concrete : Unconditional release, Conditional release, Radioactive waste.

Scenarios	Advantage	Drawbacks
Recycle 15 cm of the activated concrete	Controlled recycling of concrete	Specialised demolition technique
	Separation of activated rebars	Time consuming and higher doses for the workers
		Final structure « still radioactive »
Recycle all concrete	Controlled recycling of concrete	More difficult to separate activated and non activated rebars
	Final product has a concentration of < 0,1 Bq/gr Eu-152	
	Use of conventional demolition technique	
	Low exposure of workers	

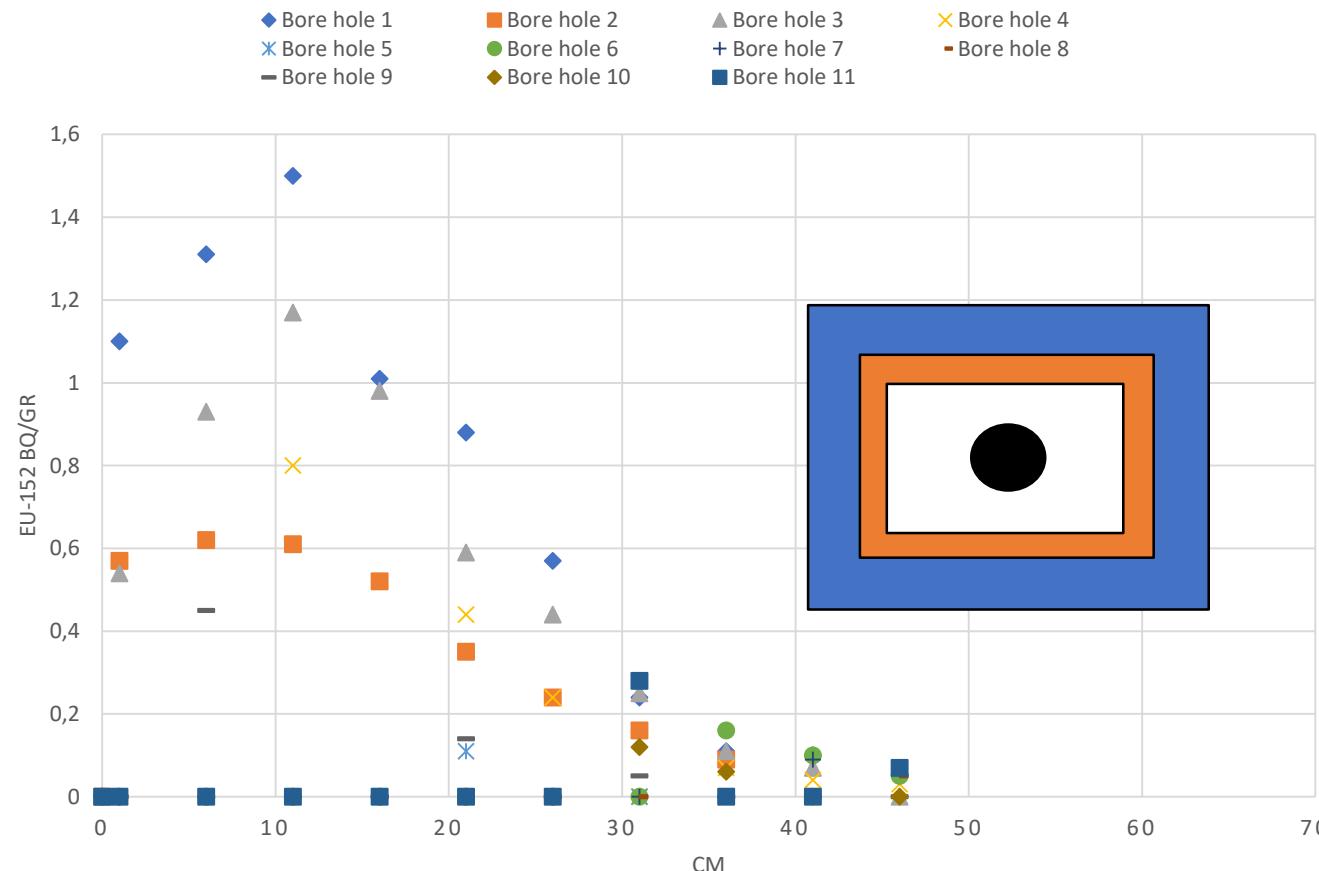

Van Driel A., et al, Cyclotron decommissioning-Vrij Universiteit Amsterdam, IRAP 2018

Reduction of beam loss by correctly tuning the beam

- Neutron activation study
- Transmission ratio ↑
 - Ion source (μA)/extraction mechanism (μA)
- Beam transport optimisation ↑
- Extraction ratio ↑
 - Extraction mechanism (μA)/target (μA)
- Vacuum level ↓
 - Cyclotron off
 - Beam on

Facility design improvements (new site)

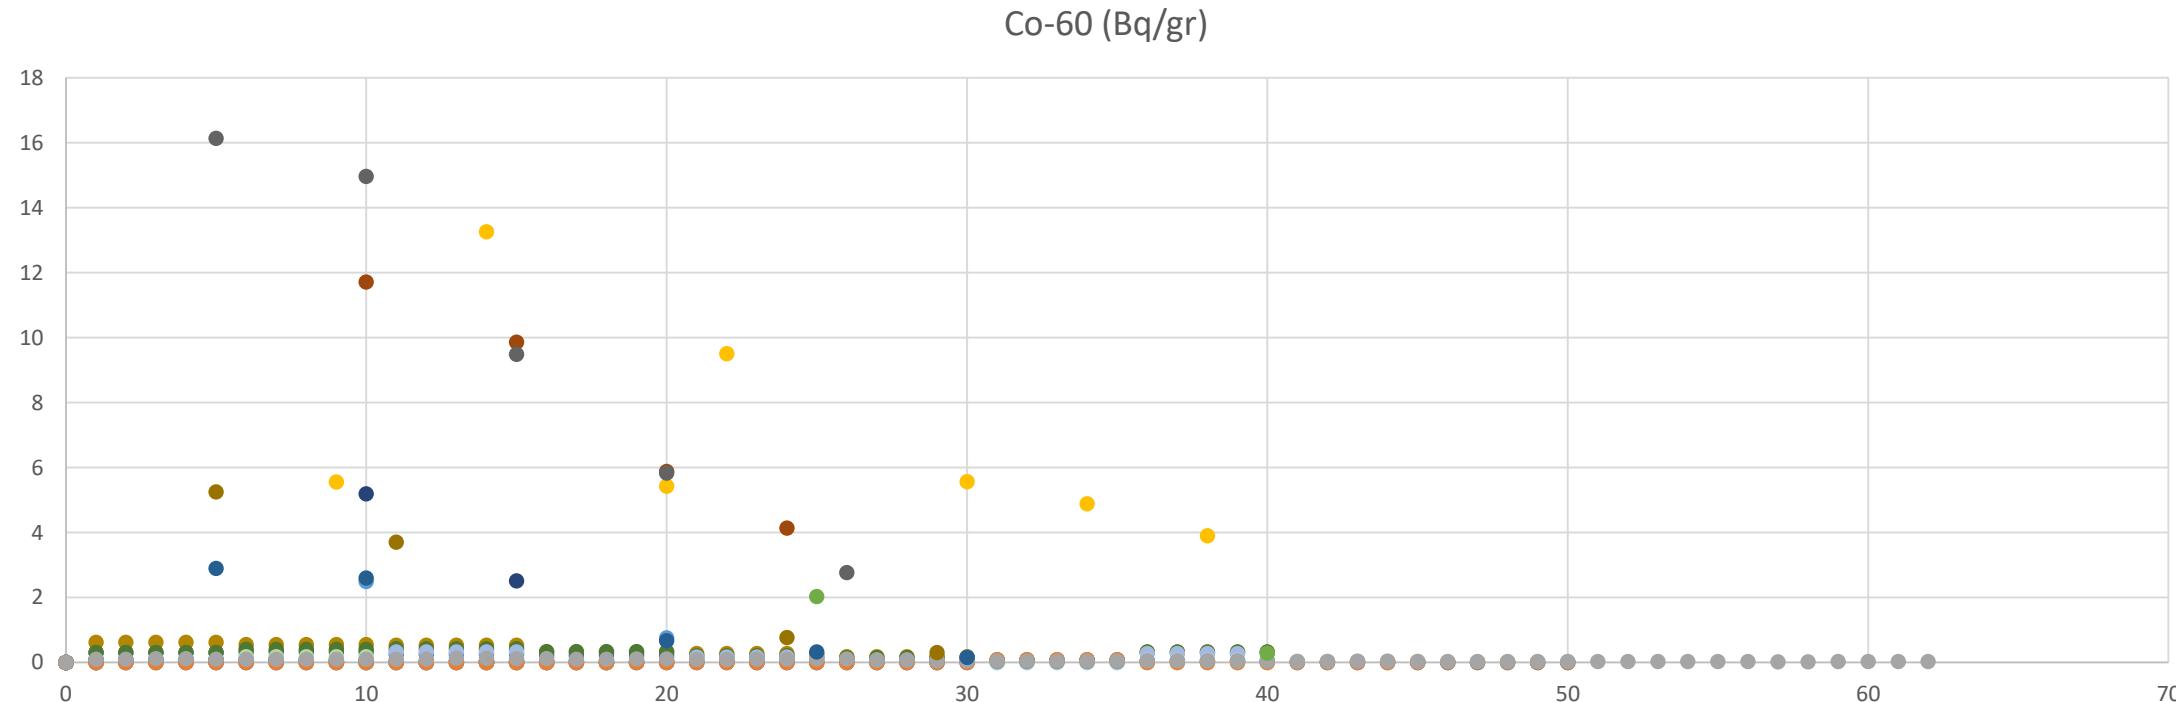

European Patent 3 266 754 A (Eu-152)

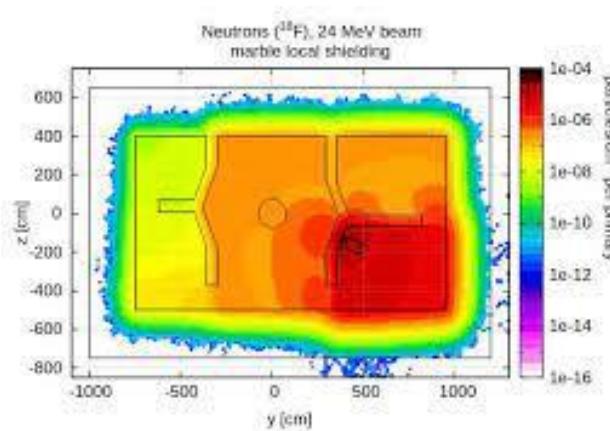

Kinno M., et al, Raw materials for low-activation concrete neutron shields, Journal of Nuclear Science and Technology, Volume 39, December 2002, 12.

- LAC (Low Activation Concrete) inner layer, Fiberglass rebars structure instead of steel rod for concrete reenforcement (Co-60)
- Physical separation between the two concrete layers (LAC/rest)
- Removable bore hole with an harmonization of bore hole sizes (length 10 > 280 cm, diameter 4 > 7.4 cm, cutting position in depth 2 > 10 cm (n=65))
- Lego bricks
- Stable Eu concentration measurement

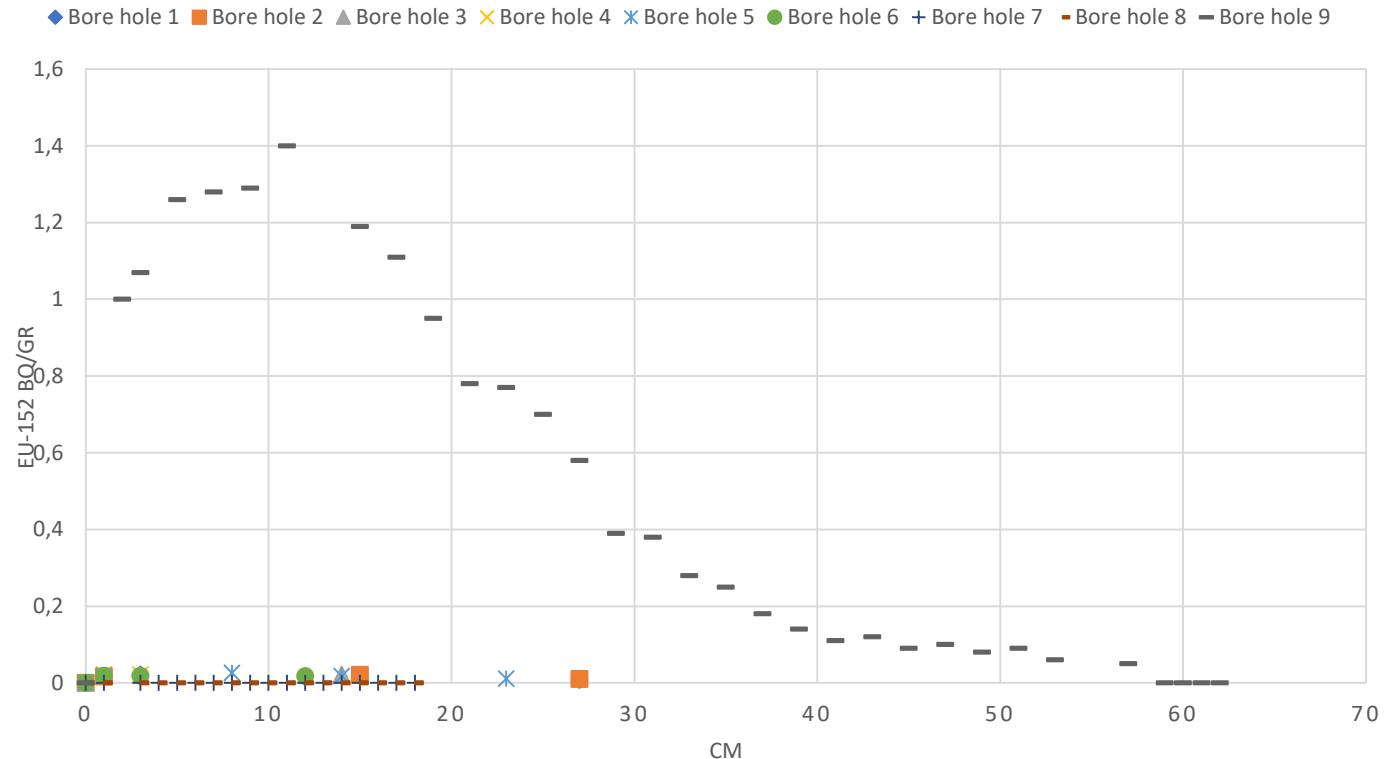

Facility design improvements (new site) – steel rebars

Optional advantages – sacrificial shielding (new site)

Asova G. et al, Status of simulation for the cyclotron laboratory at the institute for nuclear research and nuclear energy, IOP Conf.Series: Journal of physics. Conf.Series 1023 (2018) 012008, doi : 10.1088/1742-6596/1023/1/012008

Design improvements, cyclotron and auxiliary equipment (new site)

IMPROVED DESIGN SUGGESTION AUXILARY EQUIPMENT?

- General tools
- Dedicated tools for maintenance
- Water manifold
- Water pump
- Ion exchange resin
- Heat exchanger
- Waste pit
- False floor
- Addition of sacrificial shielding layer around the target
- ...
